# Reality

## Developer Centric Approach

- ❑ Prioritize developer productivity.
- ❑ Design intuitive, user-friendly interfaces.
- ❑ On demand access to resources, no manual provisioning, one click rollbacks, pre-configured deployment templates for common environments.

# Abstraction of Complexities

- ❑ Management of multiple & complex YAML files
- ❑ Abstracting Network complexities
- ❑ Integration of cloud-native tools
- ❑ Orchestration of Clusters

# Standardization

# Releases

The releases feature simplifies the deployment process by packaging all essential details, including microservices, dependencies and release sequences, into a single bundle.

This centralization bridges the gap between teams, providing a comprehensive view for Release Managers.

The screenshot displays the Devtron Releases interface. At the top, the breadcrumb navigation shows 'Releases / demo-release-track / Second Release'. Below this, there are tabs for 'Overview', 'Requirements', and 'Deploy'. The 'Requirements' tab is active, showing a list of applications: 'slo-plugin-app' (9jb8h1f1-487-3124), 'demo-react-app' (326728uh-664-4352), and 'demo-application' (v4.0.2). The 'slo-plugin-app' is selected, and its details are shown in the main panel. This panel includes a 'Commit' field with the value '7ba1d9a' and an 'Image' field with the value '9jb8h1f1-487-3124'. Both fields have a 'Merge pull request #15 from ...' link. Below these fields is a section for 'Release instructions' with a placeholder text: 'This section is to add instructions for this release'. On the right side, there are two environments listed: 'stage' and 'testng'. At the bottom right, there is a 'Go To Deploy' button. The interface also includes a 'Draft' button and a 'Mark the release as ready' button at the top right.

# How Is Devtron Different?

## Devtron

- ✓ On-prem security - “trust yourself”
- ✓ Single pane Build and Deployment system with RBAC
- ✓ Collaboration as integral part of the platform
- ✓ Includes Kubernetes cluster and workload visibility
- ✓ Includes Kubernetes cluster and workload debugging capability

## Others

- ✗ SaaS security - “trust us”
- ✗ Disconnected Build and Deployment system
- ✗ Collaboration happens outside the tool
- ✗ Limited Kubernetes cluster and workload visibility
- ✗ Limited Kubernetes cluster and workload debugging capability

Platform engineering is like a gym membership. Anyone can buy into it, but results require actual work.
